

The system allows for multiple labour lines on Jobs, which will record times worked on specified tasks for both billing and productivity purposes.

This will allow the system to automatically track each technician's work times, also allowing for multiple technicians to have worked on one job.

The technician will clock IN on a Biometric device, accessing allocated jobs/tasks through the use of Barcodes (14 alphanumeric digits), such as "Oil Change", "Rotating Tyres", etc.

Each time a technician clocks IN and OUT on one of these jobs/tasks, the total hours will automatically add up, resulting in accurate billing.

HOW IT WORKS

A jobcard will be created with the barcode corresponding to the job/task to be completed

The Technician will scan their fingerprint on a biometric device to positively identify them

The barcode will then be scanned and the hours spent on the job/task will start to calculate

Once the job/task has been completed, the Technician will clock OUT and scan the barcode again

The clocking data is then sent to the system, which can then be used for accurate billing

ADD-ONS:

- Time & Attendance
- Access Control
- Visitor Management
- Breathalyzers

ERSBio integrates with evolve.
